AB The invention provides pharmaceutical dosage forms of AG 013736 or salts, solvates or prodrugs. The invention further provides methods of treating abnormal cell growth, such as cancers, by administering the dosage forms to a mammal. A high-dose combination therapy of AG 013736 ad docetaxel generates greater delay of primary tumor growth and metastasis than either monotherapy alone.

ABSTRACT:
AG-013736 is an oral anti-angiogenesis agent with activity against a variety of receptor tyrosine kinases, including VEGFR-1, VEGFR-2, VEGFR-3, c-kit, and PDGFR-beta. A phase 2 study was conducted in patients with poor prognosis AML or MDS. Twelve patients (six AML; six MDS) were treated with AG-013736 at a dose of 10mg orally daily for a median of 56 days (range, 1-248 days). Median age was 80 years (range, 58-88 years). Grade 3 or 4 drug-related toxicities included hypertension (42%), mucositis (8%) and deep venous thrombosis (8%). No objective responses occurred; two patients with MDS had stable disease for 8.3 and 6.2 months, respectively. Bone marrow expression of VEGFR-1 and VEGFR-2 was observed in 11% and 0% of patients, respectively. Sustained decreases in soluble VEGFR-2 plasma levels with concomitant elevation in plasma VEGF and placental growth factor levels were obtained during the course of therapy with AG-013736. AG-01736 had minimal biologic or clinical activity in this elderly patient population.

ABSTRACT:
PURPOSE: We studied the safety, clinical activity, and pharmacokinetics (PK) of AG-013736, an oral receptor tyrosine kinase inhibitor of vascular endothelial cell growth factor, platelet-derived growth factor, and c-Kit, in patients with advanced cancer. PATIENTS AND METHODS: Patients received fixed doses of AG-013736 orally in 28-day cycles. In the first cohort, patients initially received two single test doses of AG-013736 (10 and 30 mg); subsequent dosing was determined by individual PK parameters. Doses in subsequent cohorts were assigned by using a traditional dose-escalation/de-escalation rule based on observed toxicities in the current and previous cohorts. PK analysis included evaluation of the effect of food and antacid. RESULTS: Thirty-six patients received AG-013736 at doses ranging from 5 to 30 mg by mouth twice daily. The dose-limiting toxicities observed included hypertension, hemoptysis, and stomatitis and were seen primarily at the higher dose levels. The observed hypertension was manageable with medication. Stomatitis was generally tolerable and managed by dose reduction or drug holidays. AG-013736 was absorbed rapidly, with peak plasma concentrations observed within 2 to 6 hours after dosing. The maximum-tolerated dose and recommended phase II dose of AG-013736 is 5 mg, twice daily, administered in the fasted state. No significant drug interaction with antacid was seen. There were three confirmed partial responses and other evidence of clinical activity. CONCLUSION: In this study, we have demonstrated clinical activity and safety of AG-013736 in patients with advanced solid tumors and identified the dose for phase II testing. The unique phase I study design allowed early identification of important absorption and metabolic issues critical to phase II testing of this agent.

ABSTRACT:
PURPOSE: Identifying suitable markers of biologic activity is important when assessing novel compounds such as angiogenesis inhibitors to optimize the dose and schedule of therapy. Here we present the pharmacodynamic response to acute dosing of AG-013736 measured by dynamic contrast-enhanced magnetic resonance imaging (DCE-MRI). PATIENTS AND METHODS: Thirty-six patients with advanced solid tumors were treated with various doses of AG-013736. In addition to standard measures of objective disease response and pharmacokinetic analysis, DCE-MRI scans were acquired at baseline and repeated at cycle 1--day 2 after the scheduled morning dose of the AG-013736 in 26 patients. Indicators of a

vascular response, such as the volume transfer constant (K(trans)) and initial area under the curve (IAUC), were calculated to assess the effect of treatment on tumor vascular function. RESULTS: Evaluable vascular response data were obtained in 17 (65%) of 26 patients. A linear correlation was found in which the percentage change from baseline to day 2 in K(trans) and IAUC was inversely proportional to AG-013736 exposure. Using a conservative a priori assumption that a > or = 50% decrease in K(trans) was indicative of an objective vascular response, a 50% decrease in K(trans) was achieved and corresponded to a plasma AUC(0-24) of > 200 ng . h/mL. CONCLUSION: A sufficient decrease in tumor vascular parameters was observed at a dose chosen for additional phase II testing by conventional toxicity criteria. In addition, the day 2 vascular response measured using DCE-MRI seems to be a useful indicator of drug pharmacology, and additional research is needed to determine if it is a suitable marker for predicting clinical activity.

ABSTRACT:

A Phase II study of p.o. AG-013736 in 12 elderly patients with poor prognosis acute myeloid leukemia (AML) or myelodysplastic syndrome (MDS) is reported. Side-effects included hypertension, mucositis, DVT, hoarseness, proteinuria and diarrhea. There were no responses. AG-013736 was well tolerated and further trials in combination with other treatment are considered warranted. (conference paper: 46th Annual Meeting of the American Society of Hematology,

ABSTRACT:

This pharmacokinetic (PK)/pharmacodynamic (PD) study was carried out in mice (bearing human colon carcinoma MV522 tumors) that were treated with various concentrations of p.o. or infused AG-013736. Based on clinical PK parameters and parameters from mouse PK/PD modeling, human PK/PD simulation was performed to investigate clinical dose projection. This line of research emphasizes the complexity of PK/PD modeling and the necessity of understanding and conducting the appropriate preclinical PK/PD studies in order to better aid clinical dose projection for the development of anti-cancer agents. (conference abstract: 96th Annual Meeting of the American Association for Cancer Research, Anaheim, California, USA, April 16-20, 2005).

ABSTRACT:

The pharmacokinetics, safety and efficacy of p.o. AG-013736 was investigated in a phase I study of 36 patients with advanced solid tumors. The maximum tolerated dose of AG-013736 was 5 mg, b.i.d., with dose-limiting toxicities of hypertension, hepatopathy, thrombosis, pancreatitis and stomatitis. Results demonstrate the promising anticancer activity of AG-013736. ABSTRACT:

AG-013736 was given in escalating p.o. doses to 30 patients (pts) with solid tumors. The primary objective was to determine the maximum tolerated dose (MTD) and safety. Pharmacokinetics (PK), tumor vascular response by dceMRI, and efficacy were also evaluated. Tumor diagnoses were: breast (11), thyroid (5), renal cell (5), lung (4), and other (5). Toxicity included hypertension (HTN), seizure, hepatopathy, pancreatitis, apnea and stomatitis. 2 Durable partial responses were seen (in renal cell and adenoid cystic carcinomas) and stable disease lasting at least 4 mth (range: 4-13+ mth) was achieved in 5 pts of this heavily pretreated population. AG-013736 is concluded to be a highly active agent as manifested by clinical response and acute tumor vascular changes. (conference abstract: 2003 AACR-NCI-EORTC International Conference, Boston, Massachusetts, USA, 17-21 November, 2003).

AB This invention relates to methods for preparing indazole derivs. I [wherein R1 = (un)substituted -CH=CH-R5 or -CH=N-R5; R2 = (un)substituted (cyclo)alkyl, (cyclo)alkoxy, aryloxy, (hetero)aryl, etc.; R3 and R4 = independently H, halo, or (un)substituted alkyl; R5 = (un)substituted (cyclo)alkyl, heterocycloalkyl, or (hetero)aryl], or pharmaceutically acceptable salts or solvates thereof. For example, intermediates 6-iodo-3-((E)-2-pyridin-2-yl-vinyl)-1-(tetrahydropyran-2-yl)-1H-indazole and 2-mercapto-N-methylbenzamide were prepared in multi-step syntheses comprising Heck vinylation, reduction, diazotization, and iodination reactions. The intermediates obtained in previous step were reacted in DMF at 80 °C for 4-16 h in the presence of palladium catalyst and cesium carbonate, followed by deprotecting the tetrahydropyanyl group in methanol in the presence of p-toluenesulfonic acid to give II in moderate yield. The title compds. are useful as modulators and/or inhibitors of protein kinases for the treatment of cancer or other diseases (no data).

* STRUCTURE DIAGRAM TOO LARGE FOR DISPLAY - AVAILABLE VIA OFFLINE PRINT *

AB The invention relates to a group of aminopteridinones I, which are useful for the treatment of diseases which involve cell proliferation. In compds. I, R1 and R2 are independently selected from H and (un)substituted C1-6 alkyl, or R1 and R2 together form a 2- to 5-membered alkylene bridge, optionally containing 1 or 2 heteroatoms; R3 is (un)substituted C1-12 alkyl, C2-12 alkenyl, C2-12 alkynyl, C6-14 aryl, etc.; R4 is H, OH, CN, halo, (un)substituted amino, (un)substituted C1-6 alkyl, C1-5 alkoxy, etc.; L is (un)substituted C2-10 alkylene, (un)substituted C2-10 alkenylene, (un)substituted C6-14 arylene, etc.; R5 is (un)substituted morpholinyl, (un)substituted piperidinyl, (un)substituted piperazinyl, (un)substituted piperazinylcarbonyl, (un)substituted pyrrolidinyl, (un)substituted thiomorpholinyl, etc.; n is 0 or 1; and m is 1 or 2; including tautomers, stereoisomers, salts, solvates, polymorphs, and prodrugs thereof. The invention also relates to the preparation of I, pharmaceutical compns. comprising a compound I, at least one other therapeutic agent, optionally with one or more pharmaceutically acceptable excipients, as well as to the use of the compns. for the treatment of diseases which involve cell proliferation, migration or apoptosis of cancer cells, or angiogenesis. Esterification of (R)-2-aminobutyric acid and reductive condensation with cyclopentanone gave cyclopentylamine II, which underwent regioselective substitution of 2,4-dichloro-5-nitropyrimidine and reductive heterocyclization to form pteridinone III. N-Methylation of III followed by substitution with 4-amino-3-methoxybenzoic acid and amidation with 1-methyl-4-aminopiperidine resulted in the formation of aminopteridinone IV. A combination of suboptimal doses of irinotecan and compound IV shows an additive/synergistic effect in a human colon carcinoma model and is well tolerated. Meanwhile, compound IV acts at least additively with docetaxel in a human non-small cell lung carcinoma model and not antagonistically with gemcitabine in a human adenocarcinoma model.

AB The present invention relates to methods for preparing indazole compds. which are useful as modulators and/or inhibitors of protein kinases. The present invention also relates to intermediate compds. useful in the preparation of the compds. E.g., I was prepared by reaction of 2-(3-iodo-1H-indazol-6-ylsulfanyl)-N-methylbenzamide and 2-vinylpyridine.

AB Tumor blood vessels normalized by antiangiogenic therapy may provide improved delivery of chemotherapeutic agents during a window of time but it is unknown how protein expression in tumor vascular endothelial cells changes. We evaluated the distribution of RGD-4C phage, which binds αv{szligbeta}3, αv{szligbeta}5, and α5{szligbeta}1 integrins on tumor blood vessels before and after antiangiogenic therapy. Unlike the control phage, fd-tet, RGD-4C phage homed to vascular endothelial cells in spontaneous tumors in RIP-Tag2 transgenic mice in a dose-dependent fashion. The distribution of phage was similar to αv{szligbeta}3 and α5{szligbeta}1 integrin expression. Blood vessels that survived treatment with AG-013736, a small mol. inhibitor of vascular endothelial growth factor and platelet-derived growth factor receptors, had only 4% as much binding of RGD-4C phage compared with vessels in untreated tumors. Cellular distribution of RGD-4C phage in surviving tumor vessels matched the α5{szligbeta}1 integrin expression. The reduction in integrin expression on tumor vessels after antiangiogenic therapy raises the possibility that integrin-targeted delivery of diagnostics or therapeutics may be compromised. Efficacious delivery of drugs may benefit from identification by in vivo phage display of targeting peptides that bind to tumor blood vessels normalized by antiangiogenic agents.

ED Entered STN: 01 May 2006
AB The properties of several multitargeted receptor tyrosine kinase inhibitors were studied for their inhibition of colony-stimulating factor-1 receptor (CSF-1R) signaling. A structurally novel, multitargeted tyrosine kinase inhibitor (ABT-869), imatinib (STI571), and 4 compds. currently in clin. development (AG013736, BAY 43-9006, CHIR258, and SU11248) were tested for inhibition of CSF-1R signaling in both the enzymic and cellular assays. ABT-869 showed potent CSF-1R inhibition in both the enzyme and cell-based assays (IC50s < 20 nmol/L). In contrast to a previous report, we have found that imatinib has activity against human CSF-1R in both assays at submicromolar concns. In enzyme assays, we have found that the inhibition of CSF-1R by both ABT-869 and imatinib are competitive with ATP, with Ki values of 3 and 120 nmol/L, resp. SU11248 is a potent inhibitor of CSF-1R in the enzyme assay (IC50 = 7 nmol/L) and inhibits receptor phosphorylation in the cellular assay (IC50 = 61 nmol/L). AG013736 was also a potent inhibitor of CSF-1R in both assays (enzyme, IC50 = 16 nmol/L; cellular, IC50 = 21 nmol/L), whereas BAY 43-9006 is less potent in the enzyme assay (IC50 = 107 nmol/L) than in the

cellular system (IC50 = 20 nmol/L). In contrast, we found that CHIR258 had less activity in the cellular assay (IC50 = 535 nmol/L) relative to its enzymic potency (IC50 = 26 nmol/L). These results show the use of a cell-based assay to confirm the inhibitory activity of lead compds. and drug candidates, such as ABT-869, against the CSF-1R protein in situ.

AB Indazole compds. that modulate and/or inhibit the activity of certain protein kinases are described. These compds. and pharmaceutical compns. containing them are capable of mediating tyrosine kinase signal transduction and thereby modulate and/or inhibit unwanted cell proliferation. The invention is also directed to the therapeutic or prophylactic use of pharmaceutical compns. containing such compds., and to methods of treating cancer and other disease states associated with unwanted angiogenesis and/or cellular proliferation, such as diabetic retinopathy, neovascular glaucoma, rheumatoid arthritis, and psoriasis, by administering effective amts. of such compds.

AB Purpose: We studied the safety, clin. activity, and pharmacokinetics (PK) of AG-013736, an oral receptor tyrosine kinase inhibitor of vascular endothelial cell growth factor, platelet-derived growth factor, and c-Kit, in patients with advanced cancer. Patients and Methods: Patients received fixed doses of AG-013736 orally in 28-day cycles. In the first cohort, patients initially received two single test doses of AG-013736 (10 and 30 mg); subsequent dosing was determined by individual PK parameters. Doses in subsequent cohorts were assigned by using a traditional dose-escalation/de-escalation rule based on observed toxicities in the current and previous cohorts. PK anal. included evaluation of the effect of food and antacid. Results: Thirty-six patients received AG-013736 at doses ranging from 5 to 30 mg by mouth twice daily. The dose-limiting toxicities observed included hypertension, hemoptysis, and stomatitis and were seen primarily at the higher dose levels. The observed hypertension was manageable with medication. Stomatitis was generally tolerable and managed by dose reduction or drug holidays. AG-013736 was absorbed rapidly, with peak plasma concns. observed within 2 to 6 h after dosing. The maximum-tolerated dose and recommended phase II dose of AG-013736 is 5 mg, twice daily, administered in the fasted state. No significant drug interaction with antacid was seen. There were three confirmed partial responses and other evidence of clin. activity. Conclusion: In this study, we have demonstrated clin. activity and safety of AG-013736 in patients with advanced solid tumors and identified the dose for phase II testing. The unique phase I study design allowed early identification of important absorption and metabolic issues critical to phase II testing of this agent.

AB Purpose: Identifying suitable markers of biol. activity is important when assessing novel compds. such as angiogenesis inhibitors to optimize the dose and schedule of therapy. Here we present the pharmacodynamic response to acute dosing of AG-013736 measured by dynamic contrast-enhanced magnetic resonance imaging (DCE-MRI). Patients and Methods: Thirty-six patients with advanced solid tumors were treated with various doses of AG-013736. In addition to standard measures of objective disease response and pharmacokinetic anal., DCE-MRI scans were acquired at baseline and repeated at cycle 1-day 2 after the scheduled morning dose of the AG-013736 in 26 patients. Indicators of a vascular response, such as the volume transfer constant (Ktrans) and initial area under the curve (IAUC), were calculated to assess the effect of treatment on tumor vascular function. Results: Evaluable vascular response data were obtained in 17 (65%) of 26 patients. A linear correlation was found in which the percentage change from baseline to day 2 in Ktrans and IAUC was inversely proportional to AG-013736 exposure. Using a conservative a priori assumption that a ≥50% decrease in Ktrans was indicative of an objective vascular response, a 50% decrease in Ktrans was achieved and corresponded to a plasma AUC0-24 of > 200 ng · h/mL. Conclusion: A sufficient decrease in tumor vascular parameters was observed at a dose chosen for addnl. phase II testing by conventional toxicity criteria. In addition, the

day 2 vascular response measured using DCE-MRI seems to be a useful indicator of drug pharmacol., and addnl. research is needed to determine if it is a suitable marker for predicting clin. activity.

AB Polypeptides containing the kinase domain of human vascular endothelial growth factor receptor tyrosine kinase (VEGFR) are described. Also described are crystal structures of these polypeptides, including the crystal structures of VEGFR2 kinase domain-ligand complexes. The atomic coordinates derived from the crystal structures provide a three-dimensional description of the ligand-binding pocket of the kinase domain useful in drug discovery and design for the identification and design of modulators of kinase activity.

AB Angiogenesis inhibitors are receiving increased attention as cancer therapeutics, but little is known of the cellular effects of these inhibitors on tumor vessels. We sought to determine whether two agents,

AG013736 and VEGF-Trap, that inhibit vascular endothelial growth factor (VEGF) signaling, merely stop angiogenesis or cause regression of existing tumor vessels. Here, we report that treatment with these inhibitors caused robust and early changes in endothelial cells, pericytes, and basement membrane of vessels in spontaneous islet-cell tumors of RIP-Tag2 transgenic mice and in s.c. implanted Lewis lung carcinomas. Strikingly, within 24 h, endothelial fenestrations in RIP-Tag2 tumors disappeared; vascular sprouting was suppressed, and patency and blood flow ceased in some vessels. By 7 days, vascular d. decreased more than 70%, and VEGFR-2 and VEGFR-3 expression was reduced in surviving endothelial cells. Vessels in Lewis lung tumors, which lacked endothelial fenestrations, showed less regression. In both tumors, pericytes did not degenerate to the same extent as endothelial cells, and those on surviving tumor vessels acquired a more normal phenotype. Vascular basement membrane persisted after endothelial cells degenerated, providing a ghost-like record of pretreatment vessel number and location and a potential scaffold for vessel regrowth. The potent anti-vascular action observed is evidence that VEGF signaling inhibitors do more than stop angiogenesis. Early loss of endothelial fenestrations in RIP-Tag2 tumors is a clue that vessel phenotype may be predictive of exceptional sensitivity to these inhibitors.

AB Indazole compds. I [R1 = substituted or unsubstituted aryl or heteroaryl, R3CH:CH, R3N:CH; R2 = substituted or unsubstituted aryl, heteroaryl, Y-X; R3 = substituted or unsubstituted alkyl alkenyl, cycloalkyl,

heterocycloalkyl, aryl, heteroaryl; Y = O, S, C(:CH2), CO, SO, SO2, alkylidene, NH, N(C1-C8 alkyl); X = substituted or unsubstituted aryl, heteroaryl, NH(alkyl), NH(cycloalkyl), NH(heterocycloalkyl), NH(aryl), NH(heteroaryl), NH(alkoxy), NH(dialkylamide)] and their pharmaceutically acceptable prodrugs, active metabolites, and salts are disclosed. The compds. modulate and/or inhibit the activity of certain protein kinases. In particular, I and pharmaceutical compns. containing them are capable of mediating tyrosine kinase signal transduction, and thereby modulate and/or inhibit unwanted cell proliferation. The invention is also directed to the therapeutic or prophylactic use of pharmaceutical compns. containing such compds., and to methods of treating cancer and other disease states associated with unwanted angiogenesis and/or cellular proliferation, such as diabetic retinopathy, neovascular glaucoma, rheumatoid arthritis, and psoriasis, by administering effective amts. of such compds. E.g., I [R1 = (E)-3,4-(MeO)2C6H3CH:CH; R2 = 4-HO-3-MeOC6H3] (II) was prepared from 6-aminoindazole by diazotization and substitution with iodide, protection of the indazole nitrogen with 2,4,6-Me3C6H2SO2Cl, coupling of the regioisomeric mixture with 4-(methoxymethoxy)-3-methoxybenzeneboronic acid in the presence of dichlorobis(triphenylphosphine)palladium, and deprotection of the indazole moiety and iodination at the 3-position of the indazole. Treatment of the 3-indazolyl iodide with sec-butyllithium, phenyllithium, and DMF, regioselective protection of the indazole with 2,4,6-Me3C6H2SO2Cl, olefination with 3,4-dimethoxybenzyltriphenylphosphonium bromide, deprotection of the indazole, deprotection of the methoxymethyl group, and equilibration of the double bond with iodine gave II. Biol. data on protein kinase inhibition, cell proliferation inhibition, neovascularization inhibition, and i.p. and oral bioavailability, are given.

ABSTRACT:
The invention provides pharmaceutical dosage forms of AG 013736 or salts, solvates or prodrugs. The invention further provides methods of treating abnormal cell growth, such as cancers, by administering the dosage forms to a mammal. A high-dose combination therapy of AG 013736 ad docetaxel generates greater delay of primary tumor growth and metastasis than either monotherapy alone.

REFERENCE TEXT: RefID: 740156
ACTION - Potent, selective and orally active inhibitor of VEGFR/PDGFR (vascular endothelial growth factor receptor/platelet-derived growth factor receptor) tyrosine kinases, currently in phase I clinical trials in patients with advanced solid tumors. It inhibited VEGFR1 and VEGFR2 tyrosine kinases (Ki = 2.6 and 3.7 nM, respectively), VEGF-induced phosphorylation of VEGFR2 (IC50 = 7.2 nM) and MAPK in human umbilical vein endothelial cells (HUVEC). It also inhibited VEGFR2 and PDGFRbeta phosphorylation in rat retina and human tumor xenografts following single oral doses, as well as VEGF-induced skin vascular leakage in mice when administered as single oral doses of 0.3-10 mg/kg. Compound exhibited broad antitumor activity in preclinical xenograft models of human colon carcinoma MV522 (3-100 mg/kg b.i.d.), murine Lewis lung carcinoma (ED50 = 1.2 mg/kg b.i.d.), breast carcinoma BT-474 and melanoma, inhibiting tumor growth, angiogenesis and metastasis.

TX Axitinib (AG-013736; CP-868596) is a small-molecule, orally available VEGF/PDGF receptor tyrosine kinase inhibitor under development by OSI

Pharmaceuticals and Pfizer for the treatment of cancer.

Marketing

Axitinib was discovered through a collaboration between OSI and Pfizer.

Clinical

Phase II

In a multicentre Phase II trial in 52 metastatic renal cell cancer (RCC) patients, who had previously failed cytokine-based therapy, axitinib 5mg was well tolerated and had a significant objective response rate. Partial response to treatment was 46% and stable disease was experienced by 40% of patients, with a median follow-up of 12mth. No moderate or severe myelosuppression was observed; however, 31% had progressive disease, 13% have withdrawn due to adverse events and 1 PR patient relapsed. It is in Phase II trials for metastatic melanoma, refractory thyroid cancer and nsclc, as well as in combination with docetaxel in breast cancer (41st ASCO (Orlando), 2005).

Preclinical

In preclinical xenograft models, axitinib po bid inhibited angiogenesis, tumour growth and metastasis. Greater antitumour efficacy was achieved with co-administration with docetaxel cf either agent alone. In mice, t1/2 was 2hr and maximal antitumour efficacy was achieved with po administration once-daily (94th AACR (Washington, DC), 2003, Abs 3772 and 3780). Updated by LK on 28/6/2005.

TEXT
Introduction:
Pfizer is developing axitinib (AG 013736, AG 13736), a small molecule inhibitor of vascular endothelial growth factor receptor (VEGF) and platelet-derived growth factor (PDGF) receptor tyrosine kinases. It may have potential in the treatment of a variety of solid tumour types.

Key development milestones
In November 2004, Pfizer initiated a phase II study of axitinib in solid tumour patients with breast and renal cancers/1/.

Pfizer has conducted a phase I, dose-escalation study of axitinib in 30 patients with advanced solid tumours. Pfizer presented the results of the study at the AACR-NCI-EORTC International Conference on Molecular Targets and Cancer Therapeutics (AACR-NCI-EORTC-2003) in November 2003.

COMMERCIAL SUMMARY:
Cancer / VEGF receptor inhibitor

Company	Region	Launch Date	Peak Sales	Patent Expiry
Pfizer	Wrld	2009	$750m	

PHARMACOLOGY OVERVIEW:
Antimicrobial activity:

Pharmacodynamics:
Produces dose-dependent inhibition of human colorectal cancer xenografts; inhibits metastasis to lymph nodes and lung in an orthotopic melanoma model; decreases tumour vascular response; enhances tumour growth delay when co-administered with docetaxel in mice
Mechanism of action:
Platelet-derived growth factor receptor tyrosine kinase inhibitors
Tyrosine kinase inhibitors
Platelet-derived growth factor antagonists
Protein kinase inhibitors
Growth factor antagonists
Kinase inhibitors
Enzyme inhibitors
Vascular endothelial growth factor agonists
Growth factor agonists
Angiogenesis inhibitors
Activity versus parent drug: unspecified parent

CLINICAL OVERVIEW:
Route(s) of Administration: PO
Administration Freq.(per day):
Adverse events:
occasional: Anaemia, Neutropenia.
Drug Interactions:
Unknown.

Adverse Events:
Preclinical studies: in xenografts tumour models in mice, co-administration of axitinib and docetaxel was well tolerated in general, although a slight increase in bodyweight loss was noted in the combination group, compared with those treated with axitinib alone/2/.

Clinical studies: the dose-limiting toxicity (DLT) associated with axitinib at doses <= the mean tolerated dose (MTD) (5mg BD in fed patients) was grade 1 stomatitis, which was observed in one patient treated in the phase I, dose-escalation study conducted in 30 patients with advanced solid tumours. Non-dose-limiting hypertension, which was manageable with regular antihypertensive therapy, was observed in 5/12 patients. DLTs in patients treated with > the MTD were hypertension, seizures, elevated liver enzymes, pancreatitis, apnea, and stomatitis. Fatal hemotysis was also observed in two responding patients with non-small cell lung cancer, one case was 3 weeks after treatment was stopped. Non-dose limiting proteinuria was also observed/3/.
In a phase I/II trial of axitinib in combination with docatexel, the major adverse events were grade 3/4 neutropenia (n=3) and grade 3/4 anaemia (3)/4/.
Drug Interactions:

PHARMACOLOGY:
Pharmacokinetics:
Axitinib exhibited variable (39-96% CV) but linear plasma pharmacokinetics in a phase I, dose-escalation study conducted in 30 patients with advanced solid tumours. Axitinib was administered orally once or twice daily on a 28 days cycle. Peak concentrations of the drug were observed 2-4 hours post-dose. The terminal plasma t sub(1/2) was 3-5 hours. Fasted patients (no food/beverages within 2 hours of dosing) had approximately 49% higher plasma exposure levels compared with fed patients. Intra-patient variability was also reduced in fasted versus fed patients. The C sub(max) and AUC on day 15 were 54.5 ng/mL

and 311 ng x h/mL, respectively, in fed patients treated with axitinib 5mg twice daily/3/.

Plasma profiles and PK values of axitinib were not influenced by the addition of docataxel to the therapeutic regimen for patients with metastatic breast cancer/4/.

Pharmacodynamics (Cancer):

Preclinical studies: axitinib produced dose-dependent inhibition of human MV522 colon cancer xenografts and Lewis lung cancer tumour in mice, with an ED sub(50) of 1.2 mg/kg twice daily. It also inhibited metastasis to the lymph nodes and lung in an orthotopic melanoma model/5/.

Significant enhancements in tumour growth delay were observed in vivo when axitinib (3-30 mg/kg, orally administered twice daily) was co-administered with docetaxel (40 mg/kg, administered intravenously once weekly), compared with axitinib alone or docetaxel alone (100%, 65% and 9% in the respective treatment groups). In addition, survival was prolonged following co-administration of axitinib (30 mg/kg) and docetaxel (40 mg/kg), compared with each agent alone (86% vs 23%)/2/.

Clinical studies: acute decreases in tumour vascular response (>= 50% decrease in K sup(trans) and the initial area under the contrast intensity X time curve (IAUC)) were observed in 6/18 evaluable patients in a trial using dceMRI. In addition, 11/18 patients demonstrated a >= 40% decrease in both IAUC and K sup(trans). The patients were enrolled in a phase I, dose-escalation study conducted in 30 patients with advanced solid tumours/3/.

THERAPEUTIC TRIALS:

Cancer:

The mean tolerated dose of axitinib was found to be 5mg twice daily in fed patients in a phase I, dose-escalation trial conducted in 30 patients with advanced solid tumours.

Renal cancer:two durable partial responses (assessed by RECIST criteria) were observed in patients with renal cancer and adenoid cystic carcinomas. Stable disease lasting 4 months to more than 13 months was also observed in 5 heavily pretreated patients/3/.

In a phase II study, axitinib had promising efficacy in patients with cytokine-refractory metastatic renal cell carcinoma. Forty-six percent of patients achieved a partial clinical response and 40% had stable disease. The median time to disease progression was not reached after 12-18 months of follow-up/6/.

Breast cancer: treatment with axitinib + docetaxel resulted in partial responses in 2 patients and stable disease in 3 for >= 4 months. Stable disease/response was maintained in 3 patients with single-agent axitinib after treatment with the combination therapy/4/.

BASIC ABSTRACT:
WO2006030947 A UPAB: 20060510
NOVELTY - A pharmaceutical composition comprises one or more sulfonamide compound (A) of specified formula and a component (B) which inhibits

angiogenesis.

DETAILED DESCRIPTION - A pharmaceutical composition comprises one or more sulfonamide compound (A) of specified formula and a component (B) which inhibits angiogenesis.

(A) is one or more compound of formula (I)-(IV) or their salts or solvates.

E = O, N(CH3), CH2, CH2CH2, or CH2O;
D = CH2 or O;
R1a = H or halo;
R2a = halo or CF3;
J = O or NH;

R1b = H, halo, nitro, azido, OSO2CH3, N(CH3)2, OH, pyridyl, thienyl, furyl, quinolinyl or triazole; or 1-6C alkyl, 1-4C alkoxy, 1-4C alkylthio, 2-5C alkoxycarbonyl or phenyl (all optionally substituted);

R2b = H, halo, CN, or 1-6C alkyl, 1-4C alkoxy, 2-5C alkoxycarbonyl, phenyl or quinolinyl (all optionally substituted);

R3b = H or optionally substituted 1-4C alkoxy;

R4b = H or 1-6C alkyl (provided that at least one of R3b and R3c is H);

R5b = H, halo, optionally substituted 1-6C alkyl or NO2;

R6b = H, halo, or 1-6C alkyl (provided that when R6b is optionally substituted 1-6C alkyl, then R5b is H and R7b is halo)

R7b = halo or optionally substituted 1-6C alkyl (provided that when one of R5b and R7b is optionally substituted 1-6C alkyl, or R7b is halo or optionally substituted 1-6C alkyl, then one of R5b and R6b is H).

INDEPENDENT CLAIMS are also included for:

(1) pharmaceutical compositions comprising:

(a) a combination of a sulfonamide compound of formula (IX) or its salts or solvates and (B);

(b) a combination of a sulfonamide compound of formula (XIV) or its salts or solvates and one of 19 named VEGF receptor kinase inhibitor compounds (B10)-(B28);

(c) a combination of (IX) and the VEGF receptor kinase 4-(3-chloro-4-(cyclopropylaminocarbonyl)aminophenoxy)-7-methoxy-6-quinoline carboxamide (B') or its salt or solvate; and

(d) a pharmaceutical composition containing a sulfonamide compound (I)-(IV), (IX) or (XIV) for administration together with a angiogenesis inhibitor;

(2) A kit containing at least one of a package container, explanation sheet and package insert sheet which record the combined use of (A) and (B); and

(3) A kit containing a set formed of a formulation containing (A) and a formulation containing (B).

Ring A = optionally substituted mono- or bi- cyclic aromatic ring;

Ring B = optionally substituted 6-membered ring which is unsaturated carbocycle or containing 1 N as heteroatom;

Ring C = optionally substituted 5-membered heterocycle containing 1-2N;

W = bond or CH=CH;
X = N(R1) or O;
Y = C(R3) or N;
Z = NR2;

R1-R3 = H or lower alkyl;

ACTIVITY - Cytostatic; Antiangiogenic.

Cells of the human kidney cancer strain 786-O were transplanted subcutaneously into nude mice. After 7 days, the mice were treated with 100mg/kg N-(3-cyano-4-methyl-1H-indol-7-yl)-3-cyanobenzene sulfonamide (E7820) twice daily and/or 100 mg/kg 4-(3-chloro-4-(cyclopropylaminocarbonyl)aminophenoxy)-7-methoxy-6-quinoline carboxamide (B') once daily for 2 weeks. The volume of the tumors was measured at the

start of treatment and at the end of treatment, (day 22), and the ratio (volume at end of treatment)/(volume at start of treatment) was determined. Ratio was 1.61 for untreated control; 0.80 with E7820 alone; 0.59 with (B') alone; and 0.16 with E7820 + (B'); p less than 0.01 (calculated by two-way ANOVA).

MECHANISM OF ACTION - VEGF receptor kinase inhibitor; FGF receptor kinase inhibitor.

USE - The combinations and kits are used as a method of inhibiting angiogenesis and treating cancer (claimed), in the prevention, treatment, prevention of recurrence, and inhibition of metastasis of cancer, including carcinoma, myoma and melanoma, in mammals including humans. IMC-1121b, IMC-18F1, IMC-1C11 and IMC-2C6.

ADVANTAGE - The combinations have synergistic effect.

SECONDARY: A61K031-166; A61P035-00
BASIC ABSTRACT:
US2005222163 A UPAB: 20051109
NOVELTY - Treating abnormal cell growth in a patient involves administering a combination of selective cyclin-dependent kinase (CDK) inhibitor and at least one signal transduction inhibitor.

DETAILED DESCRIPTION - An INDEPENDENT CLAIM is included for a pharmaceutical composition comprising 6-acetyl-8-cyclopentyl-5-methyl-2-(5-piperazin-1-yl-pyridin-2-ylamino)-8H-pyrido(2,3-d)pyrimidin-7-one (A1) or its isethionate salt and at least one signal transduction inhibitor selected from tyrosine kinase inhibitors, mitogen-activated protein kinase (MAP)/extracellular signal regulated kinase (ERK) (MEK) inhibitors, bcr-abl tyrosine kinase inhibitors, platelet-derived growth factor receptor (PDGFR) inhibitors, c-Kit inhibitors, erbB inhibitors, vasculature epidermal growth factor receptor (VEGF-R) inhibitors, 90-kDa heat shock protein (Hsp 90) inhibitors, Aurora kinase inhibitors, Fms-like tyrosine kinase-3 (FLT-3) inhibitors, n-Ras inhibitors, phosphatidylinositol-3 (PI3) kinase inhibitors, Raf kinase inhibitors, Akt inhibitors, mammalian targret of rapamycin (mTOR) inhibitors and/or multitargeted kinase inhibitors.

ACTIVITY - Cytostatic; Neuroprotective; Vasotropic; Antiinflammatory; Angiogenesis-inhibitor. Test details are described but no results are given.

MECHANISM OF ACTION - Tumor cell growth inhibitor.

USE - For treating abnormal cell growth in a patient (claimed), for treating cancer e.g. lung cancer, bone cancer, ovarian, breast or skin cancer; also for treating other disorders e.g. neuronal, glial, glandular, macrophagal or epithelial disorders, restenosis, or inflammatory, angiogenic and immunological disorders.

ADVANTAGE - The combination of CDK inhibitor and signal tranduction inhibitors produces a direct effect on the signaling pathways that promote growth, proliferation and survival of a cell and is effective in treating abnormal cell growth, preferably cancer.

TECH UPTX: 20051109
TECHNOLOGY FOCUS - PHARMACEUTICALS - Preferred Compositions: When the CDK inhibitor is CDK-4/6 inhibitor (A1), then the signal transduction inhibitor(s) is selected from MEK inhibitor; or Raf kinase inhibitor, Akt inhibitor and/or mTOR inhibitor; or Raf kinase or mTOR inhibitor; or bcr-abl tyrosine, PDGF-R, c-Kit, erbB, VEGF-R, FGFR and/or IGF1-R inhibitor; or PDGFR, erbB, or VEGF-R inhibitor; or multi-targeted kinase inhibitor. Preferred Components: The CDK inhibitor is CDK-4, CDK-6 or CDK4/6 inhibitor. CDK-4/6 inhibitor is (A1). MEK inhibitor is selected from 2-(2-chloro-4-iodo-phenylamino)-N-cyclopropylmethoxy-3,4-difluoro-benzamide or N-((R)-2,3-dihydroxy-propoxy)-3,4-difluoro-2-(2-fluoro-4-iodo-phenylamino)-benzamide. Raf kinase or mTOR inhibitor is selected from BAY 43-9006, rapamycin, CCI 779, Rad001 or Arry 142886. PDGFR, erbB, or VEGF-R inhibitor is selected from CP-868596, ST-1571, PTK-787, PKC-412, Herceptin (trastuzumab), Erbitux, Iressa (gefitinib), Tarceva (erlotinib), EKB-569, PKI-166, GW-572016, E-2-methoxy-N-(3-(4-(3-methyl-4-(6-methyl-pyridin-3-yloxy)-phenylamino)-quinazolin-6-yl)-allyl)-acetamide, CI-1033, CP-547632, ZD-6474, or Avastin (Bevacizumab). A multi-targeted kinase inhibitor is SU11248 or Gleevec. Preferred Method: The method further involves

administering at least one additional therapeutic agent selected from an antitumor agent, alkylating agent, antimetabolite, antibiotic, plant-derived antitumor agent, camptothecin derivative, interferon or a biological response modifier (preferably cis-platin, oxaliplatin, carboplatin, cyclophosphamide, 5-fluorouracil, capecitabine, cytosine, arabinosid, hydroxyurea, N-(5-(N-(3,4-dihydro-2-methyl-4-oxoquinazolin-6-ylmethyl)-N-methylamino)-2-thenoyl)-L-glutamic acid, adriamycin, bleomycin, interferon, nolvadex (tamoxifen), or casodex (4'-cyano-3-(4-fluorophenylsulfonyl)-2-hydroxy-2-methyl-3'-(trifluoromethyl)propionanilide).
